

AI Assistance, Phase 2

I used OpenAI Codex to help extend my existing Mastermind project with Wordle, test both games, and put together the required reports. Here are the three Phase II interactions that mattered most:

1. **Prompt:** Extend the existing Phase I codebase with Wordle. Keep Mastermind working, and reuse the shared game runner instead of copying the console loop.
Change: Codex added the Wordle-specific configuration, rules, feedback, and game classes, and updated Driver so either game launches through the same shared runner.
2. **Prompt:** Use this list of 50 words I'm giving you as the Wordle dictionary.
Change: Codex put the words in an external wordlist.txt file rather than hard-coding them, and added WordListLoader to read it. Wordle pulls from that same file both for picking a secret word and for checking whether a guess is allowed.
3. **Prompt:** Test the extension and repeated letters testing , and make sure Mastermind doesnt regress.
Change: Codex wrote the some of the new Wordle tests and reran the existing Mastermind ones .

AI suggestion I changed:

An earlier version had guess history printed by calling each feedback object's own toString(). I didn't keep that — the shared game runner now calls getGuess() and getFeedbackText() from the GuessFeedback interface instead. That way, Mastermind and Wordle can both display history through the same contract, without the runner caring how either feedback class formats itself internally.
