

Ashutosh Upadhyay EID: au4355

Tests ran with `sh run-tests.sh`. All tests ran with `sh run-tests.sh`.

11 Tests below:

Required Wordle example and extra letters: With APPLE as the secret and ALLEY as the guess, the feedback is C P A P A. ALLEY has two Ls, but APPLE has only one, so only one L can receive PRESENT.

Exact matches take priority: With BREAD as the secret and BLEED as the guess, the feedback is C A C A C. The first E is in the correct position. Because BREAD has only one E, the second E must be ABSENT.

More repeated-letter cases: I tested words with repeated letters in different positions. For example, BROOM against BLOOM gives C A C C C because both O's match exactly. CHESS against SHORE gives A C P P A; only one of the two guessed S's can match the secret's single S.

Feedback, wins, and absent letters: APPLE against APPLE gives C C C C C and wins the game. BRICK against HOUSE gives A A A A A and does not win. I checked that feedback appears in the same order as the letters in the guess.

Randomized Wordle scoring: I ran 200 repeatable Wordle scoring cases with different word lengths and many repeated letters. I compared each result with a separate calculation that matches exact letters first, then uses each remaining secret letter at most once. All 200 matched.

Word validation and configuration: I checked that guesses with the wrong length, numbers, spaces, or words missing from the dictionary are rejected. These guesses do not use an attempt. I also tested a three-letter game with a two-attempt limit to confirm that changed settings work.

Dictionary loading: I checked that the game loads the 50 words in the external wordlist.txt file. Additional tests cover lowercase words, duplicate entries, blank lines, comments, and words of different lengths. Missing, empty, or malformed dictionary files produce an error.

Invalid input, attempts, and history: I entered HISTORY, an invalid word, and then valid guesses. HISTORY and the invalid word left the attempt count unchanged. After valid guesses, HISTORY showed each guess and its feedback in the order entered.

Win, loss, and replay: I tested winning normally, winning on the last attempt, and losing after six valid guesses. A loss reveals the secret word. I also checked that choosing to play again starts a new game with empty history.

Locale and launch behavior: I checked that lowercase input still works when the computer's locale is set to Turkish. I also launched both games through assignment2.Driver, tested invalid launch arguments, and confirmed that a missing Wordle dictionary does not prevent Mastermind from running.

Mastermind regression coverage: I reran the original Mastermind tests after adding Wordle. They cover exact matches, misplaced pegs, repeated colors, invalid guesses, and a changed configuration. I also ran 200 repeatable Mastermind scoring cases against a separate calculation. All Mastermind checks still pass.
